VISCAN DIAGNOSTICS - CLINICAL RADIOLOGY REPORT

Advanced Maxillofacial Imaging Network - Validated Diagnostic Record

PATIENT: PRIYA SHARMA

DOB: 1998-04-12 | SEX: Female

MRN: MRN-DEMO-1001

STATUS: Final Validated Report

PATIENT ID: PAT-1001

EXAMINATION: OPG (Digital Panoramic Radiograph)

REPORT ID: RPT-2001

STUDY DATE: 2026-06-12

CLINICAL INDICATION & TECHNIQUE

Indication: Pre-treatment evaluation of third molars and baseline dental screening.

STRUCTURED OBSERVATIONS & FINDINGS

- Tooth 48 (Mandibular right third molar):
Partially erupted presenting with mesioangular impaction. Root apices lie within 1.5 mm of the superior border of the inferior alveolar nerve canal.
Diagnostic Certainty: Confirmed

- Tooth 38 (Mandibular left third molar):
Partially erupted with vertical orientation; slight superimposition of distal ramus cortical margin. [Confirmed]

- Teeth 16 and 46:
Coronal radiolucency noted on the occlusal surface of tooth 16 extending into mid-dentin without periapical rarefaction. [Confirmed]

- Alveolar Crestal Bone:
Generalized physiological bone height maintained within normal clinical limits (less than 1.5 mm from CEJ). [Descriptive]

RADIOLOGIST IMPRESSION

- Mesioangular impaction of tooth 48 in close proximity to the mandibular canal.
- Partially erupted tooth 38.
- Moderate occlusal dental caries on tooth 16.

RECOMMENDATIONS & CORRELATION

Clinical correlation recommended. Consider CBCT cross-sectional nerve localization prior to any surgical extraction of tooth 48. Operative restoration advised for tooth 16.

Reporting Radiologist: Dr. R. Mehta, MDS
